Q1. Operators in Python

ANSWER

Operator are special symbols or reserved keywords that carry out mathematical ,logical or relational computational on variables and values. There are 4 types of operators

Arithmetic operators (eg. +, -, *, /, **),

Assignment and comparison (eg. =, !=, <, >, <=, >=),

Logical operators (eg. and, or, not) and

Identity and membership operators

Q2. Operators

ANSWER

/ is known as Division, this is used to divide given number for example: 10/5=2

// is known as Floor division, this used to round of numbers for example: if the answer is actually 2.3 it rounds of the number to 2

% is known as Modulo, this is used to get the 1st number of the given series for example: input:2576 ouput:2

** is known as Power, (a**b)

Q3. for and while loop

ANSWER

For loop doesnt allow execution of statments again and again also sequential but while loop allows execution of statements again and again

Q4. range()

ANSWER

range() is used to generate a sequence of numbers

range(5)- generates exactly 5 numbers starting from 0-4

range(1,6)-generates number starting from 1-5

range(1,10,2)-generates from 1-9 but increases by 2 each time(13579)

Q5. String

ANSWER

String is the sequence of characters that consist of alphabets, spaces also number

It is also known as unicode also it is immutable

Q6. String Slice

ANSWER

1.ython

2.noithyp

3.pto

4.h

Q7. List

ANSWER

It is a build in data structure used to store collections of data, It is ordered, mutable and dynamic

Q8. List Slice

ANSWER

[30,40,50,60,70]

[50]

[10,30,50,70]

[70,60,50,40,30,20,10]

[40,50,60,70]

Q9. Index

ANSWER

Indexing represents no of elements present inside array, list and tuple

positive indexing includes from 0-N Help to arrange in given order

negative indexing includes from -1-N Help to arrange in reverse order

Q10. length
